

Eco Flo 6 Euro Deep Dish DWC

Contents:

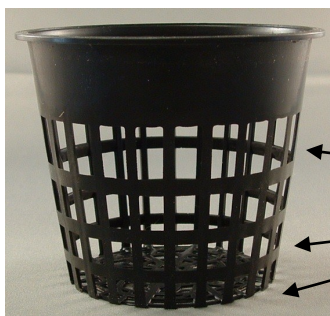

- Two outlet air pump
- Reservoir 7" with lid
- Two 30" air lines
- Air injection technology (two inlet)
- Six 3" net pots
- Red fill cap/drain plug/syringe for checking pH
- Grodan starter plugs
- Bag of Growstones grow media
- Bag of starter nutrients

Shown on blue background

Connect the two clear air tubing to the air injection and feed through the lid of the reservoir, plug into the air pump. It takes about 30 minutes for the air injection to activate. Meaning it must be submerged under water to achieve maximum production of air bubbles. Do not allow the air injection to rise out of the water. Use fresh clean water, add the nutrients about one half teaspoon per gallon for starting plants. Check your pH, level should be around 5.5—6.5. Adjust the pressure level on the air pump until you see a good amount of bubbles rising to the surface. The air pump should be left on all the time. This will provide air to the roots at all times. Change the water and nutrients every one to two weeks. Between water changes just use fresh water to top of the system. Remove drain plug to drain.

Water level

Younger plants will require a higher water level, as your plants grow you can drop the water level when the roots grow into the water.

Germination / starting plants

Please go to grodan101.com for planting seeds etc. I use a cotton swab moistened with water to pick up my seed then tap the swab to drop the seed into the grow cube. I then use the tip of a retractable pen to push the seed into the hole of the grow block.
