

## Eco Flo Euro (DWC) Assembly Guide Single, Dual, or Quad

### Contents:

- Single outlet air pump
- AIT Spider
- 3" net cup
- 3" Sure to grow media
- Drain plug/red fill cap/syringe for checking pH
- Bag of starter nutrients
- Assembly guide

Connect the clear air tubing to the AIT Spider and feed through the lid of the reservoir, plug into the air pump. It takes about 30 minutes for the air injection circle to activate. Meaning it must be submerged under water to achieve maximum production of air bubbles. Do not allow the air injection circle to rise out of the water. Use fresh clean water, add the nutrients about one half teaspoon per gallon for starting plants. Check your pH, level should be around 5.5—6.0. Adjust the pressure level on the air pump until you see a good amount of bubbles rising to the surface. The air pump should be left on all the time. This will provide air to the roots at all times. Change the water and nutrients every 7 to 10 days. Between water changes just use fresh water to top of the system.

### Water level

Younger plants will require a higher water level, 10 L mark, as your plants grow you can drop the water level when the roots grow into the water. For young plants fill the reservoir to the 10 L level.

### Germination of seed or transplanting a clone with Sure To Grow media.
